

The main layout issue I wanted to improve was how the product information was presented. I used Flexbox to place the product image and the product information beside each other on desktop. This makes better use of the space and lets the user see the product, name, price, and description without having to look through a long vertical layout. Flexbox was useful to me since it made it easier to control the spacing/alignment between these elements.

One CSS change that improved readability the most was increasing the size of the product name and price. I made the price more visually noticeable by increasing its font size and making it bold. This would help users quickly identify the most important information about the product. I also added spacing between the different parts of the product information so that they do not feel crowded together.

For the *Add to Cart* button, I gave it a distinct background color, padding, rounded corners, and bold text. I also added a hover effect that makes the button slightly lighter and bigger when the user moves their mouse over it. This gives a visual indication that the button is clickable. If the button looked the same as the other text on the page, users might not notice it or know that it is an important action.

For smaller screens, I used a media query at 768px. The product image and information change from being side-by-side to being stacked vertically, while the card becomes narrower. This makes the page easier to use on a phone. The CSS uses reusable classes like `.product-card`, `.product-details`, `.price`, and `.buy-btn`, so the same styling can be applied if more products are added.

These changes are intended to improve conversion by making the page easier to understand and by making the *Add to Cart* button more noticeable. Users can scan the product information faster and find the price and button more easily. If the button rate did not improve, I would first test a different button design or placement. This would help determine whether the CTA itself is the reason users are not clicking.
